Ai Declaration:

This is here because the Final POE brief asks for a summary of how we used generative AI during this last phase (max 500 words).

Scope of AI Usage:

We used generative AI tools (ChatGPT and GitHub Copilot) as assistive tools during this final phase, never as a replacement for our own engineering work. Everything AI gave us was reviewed, tested and adapted before we put it in the project. Some stuff we scrapped completely because it didn't fit.

Specific Uses:

Debugging Build and Compiler Errors: AI was consulted to make sense of cryptic Gradle sync errors and Kotlin compiler messages (especially Compose stuff). Suggested fixes were checked manually in Android Studio.

Scaffolding the New Advanced Features: AI helped us scaffold the boilerplate for the Part 3 features — things like the BiometricPrompt setup for fingerprint/facial recognition, the Firebase Cloud Messaging configuration for push notifications, and the RoomDB/SQLite structure for offline sync. We then populated all of that with our own project logic.

Multi-Language Resources: AI assisted with generating the strings.xml resource files for the South African languages we included, just to get the localization structure right.

Code Optimisation: AI suggested Kotlin refactors (like replacing nested if chains with when expressions, applying sealed classes for UI state). Each suggestion was checked for readability and whether it actually made sense in our codebase.

CI/CD Troubleshooting: AI was used to figure out why our GitHub Actions workflow was failing, particularly around the automated build and test steps.

Asset Placeholders: Initial app icon concepts and Play Store screenshot mockups were generated via AI image tools then replaced or refined by our team.

Declaration:

We confirm that the architectural decisions, feature designs and final implementations reflect our understanding of the module outcomes, with AI serving strictly as a productivity aid.
